# 1 Modification History

Revision	Date	Comments
1.0	February 28, 2018	Initial Release
1.1	March 12, 2018	Described new layout of the header in the Message Window. Described new global options settable via GUI.
1.2	April 9, 2018	Enhanced search scope to include from, to, subject fields, message text and text attachments. Eliminated false negative searches by decoding base64 and quoted-printable content blocks. Enhanced mboxview index file to keep track of text content blocks to optimize message and attachments search performance. Deprecated searching of RAW mail data.
1.3	April 16, 2018	Added Next/Previous search options to Find dialog. Optimized message text search performance and significantly reduced number of cases of false positive search results.
1.4	May 5, 2018	Added Picture Viewer dialog to preview attachments with the png, jpg, jpeg, jpe, gif, bmp, ico, tif, tiff, jfif, emf, wmf, dib suffixes. The Picture Viewer is enabled by default by it can be disabled on the fly via fly via File->Options dialog.
1.0.2.6	October 8, 2018	Synchronized the version number of this document with the release number. Added context menu to the mail archive under Mail Tree, summary mail in the Summary window and attachments. Added new options to the File and View main menus. Context menus enable user to print single, group or all mails to CSV, Text or HTML files, sort mails by date, from, to, subject, size and conversation groups, find and highlight all occurrences of the searched text. This release resolves the text encoding issues in the summary window, i.e. text is shown correctly. Added image cache to properly handle inline images within an email.

## 2 Feedback

To help to improve MBox Viewer, please post reviews what works and what doesn't, create bug reports and request for enhancements. Provide as many details as possible, such as country, screenshots, etc.

## 3 Overview

MBox Viewer (or mboxview) is Windows GUI based program to view mbox files such as Thunderbird Archives, Google mail archives or simple Eml files.

The mbox viewer is a simple but quite powerful email viewer that supports the following features:

1. large file support > 4Gb
2. fast parsing of mbox archives
3. quick access to all attachments
4. preview the picture attachments
5. export of single mail in Eml
6. print all mails to CSV or Text or HTML files
7. print single mail to Text or HTML file
8. group all related mails as conversations
9. print related mails/mail group to Text or HTML file
10. find user defined text in mail's message and highlight all occurrences
11. search the date, subject, sender, message text and text appendix
12. sort by date, from, to, subject, size and conversation groups
13. support for mail's header fields and body encoded with different character sets

## 4 Installation

The executable and the source code can be downloaded from Sourceforge or Github.

<https://sourceforge.net/projects/mbox-viewer/files/>

<https://github.com/eneam/mboxviewer/releases>

Download the executable package, the latest mbox-viewer.exe-v1.0.2.6.zip, to the working directory and unzip. This will create the mbox-viewer.exe-v1.0.2.6 directory and the stand-alone mboxview.exe executable in that directory. No administrator privileges are required.

## 5 Running the MBox viewer

The mboxview program can be executed by double clicking the executable from the explorer window or from the command line by typing the command name and argument list to it.

### 5.1 Argument List Summary

The mboxview accept the following command line options.

**-FOLDER=**folderPath – the full path to the folder containing one or more mbox or eml files. Persists in the registry across multiple runs.

**-MAIL\_FILE=**fileName – full file path or just file name of mbox/eml file to load. If the full path is not specified, the full path is created from the folderPath and the fileName. Doesn't persist in the

registry across multiple runs.

**-EXPORT\_EML=y|n** – enables or disables automatic export of eml files generated from mbox archive. Improves traversing performance of mail if set to ‘n’. Persists in the registry across multiple runs.

**-PROGRESS\_BAR\_DELAY=seconds** – search progress bar is activated when the search duration lasts longer than the value set for PROGRESS\_BAR\_DELAY. If set to **-1**, the progress bar is disables. Default value is set to **1** seconds. Persists in the registry across multiple runs.

If desired, instead of typing directly desired command line options, a simple .cmd or .bat file can be created for convenience and run from the explorer.

## 5.2 Setting Options from GUI

The **EXPORT\_EML** and **PROGRESS\_BAR\_DELAY** values can be changed on the fly at any time from GUI.

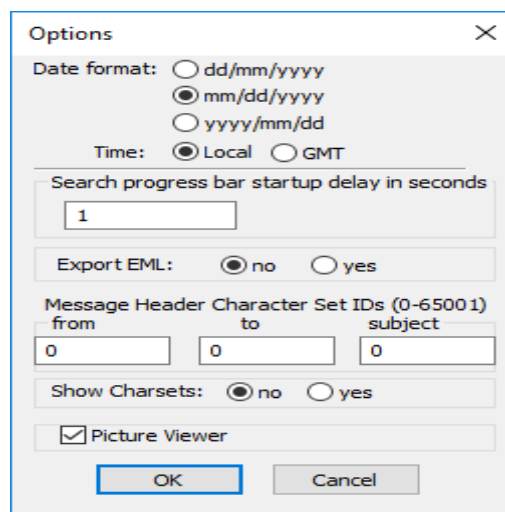

Click on the “File” to open the drop menu and then select the “Options” option. The below dialog will be presented. Set the desired values followed by OK button.

Note that if exporting of EML files is disabled, you can still export the eml file for the selected mail by selecting “View EML” under the “View” drop menu.

Two options, “**Show Charsets**” and “**Set Character Sets for Header Fields**”, can help to properly display header fields in the Message Window. See 5.14.1.1 for additional details.

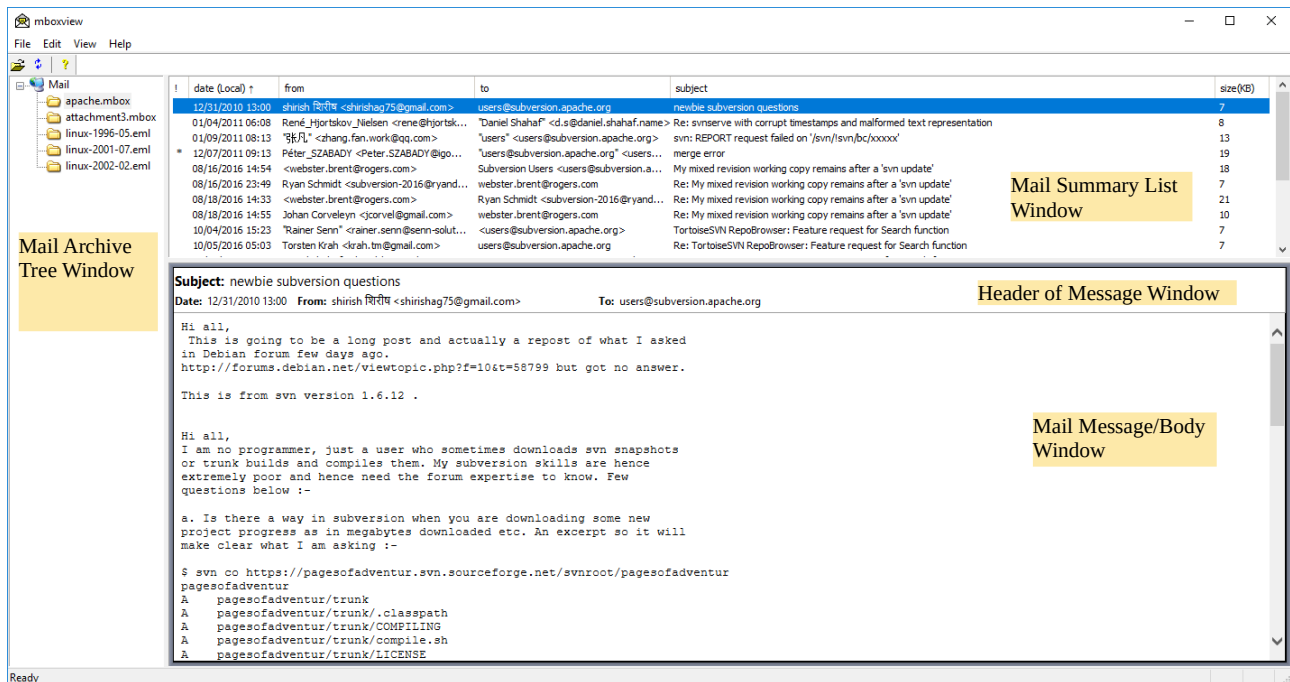

The “**Picture Viewer**” check box enables/disables the dialog option to preview the picture attachments, see 5.8 for additional details.

The “**Time**” option allows to display time as Local or GMT.

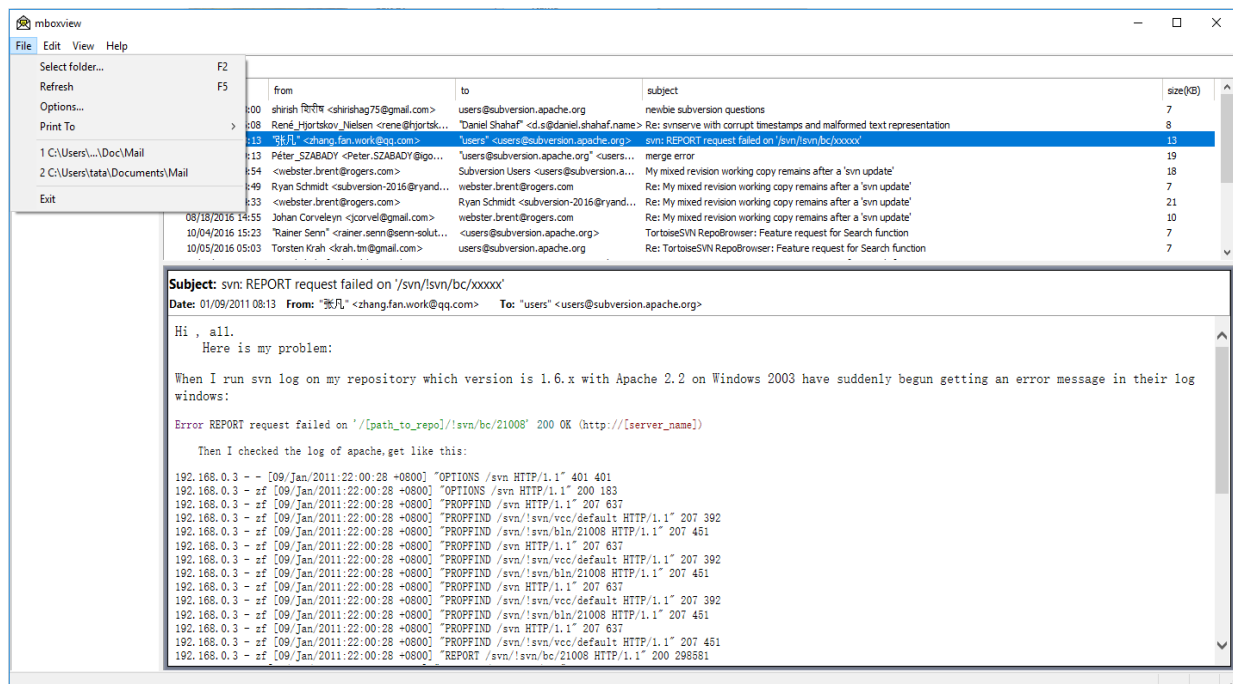

## 5.3 Basic Use Case

Double click of the mboxview to start the viewer. The picture below shows the screen created by the mboxview after few steps performed by a user. Mail Archive, Summary and Message windows are initially blank after start-up. Steps to load an archive and display the content are described next.

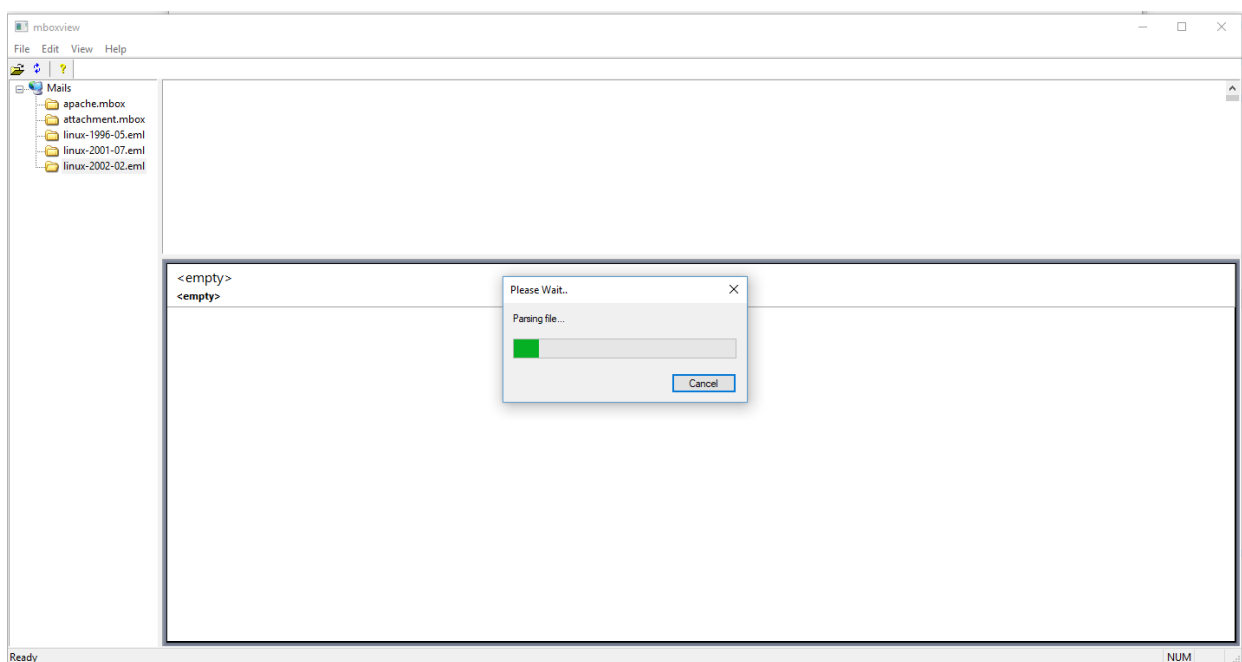

1. Click on the “File” to open the drop menu and then select the “Select folder...” option. Browse to the folder containing one or more mbox and/or eml mail archive files and select it. All valid mail archive files will appear in the Mail Archive Tree window.

2. Click on one of the archive files to load all mails of the archive. Progress bar will appear and automatically close after the selected archive is fully processed. Mail header information of each email will appear in the Summary window.

Note that parsing of very large archive file may take some time since the mail archives are text files and every character has to be examine one by one. However, subsequent loading of mails is done from the index file created by the mboxview during the initial parsing of the archive file. The created index file contains the header information, content meta data of each mail in the archive file and the position of each mail within the mail file for quick access to the mail message/body. Loading from the index file is much faster. The index files have the .mboxview suffix.

3. Left Click on one of the mails in the Summary window to show the Message/Body of that email in the Message window.

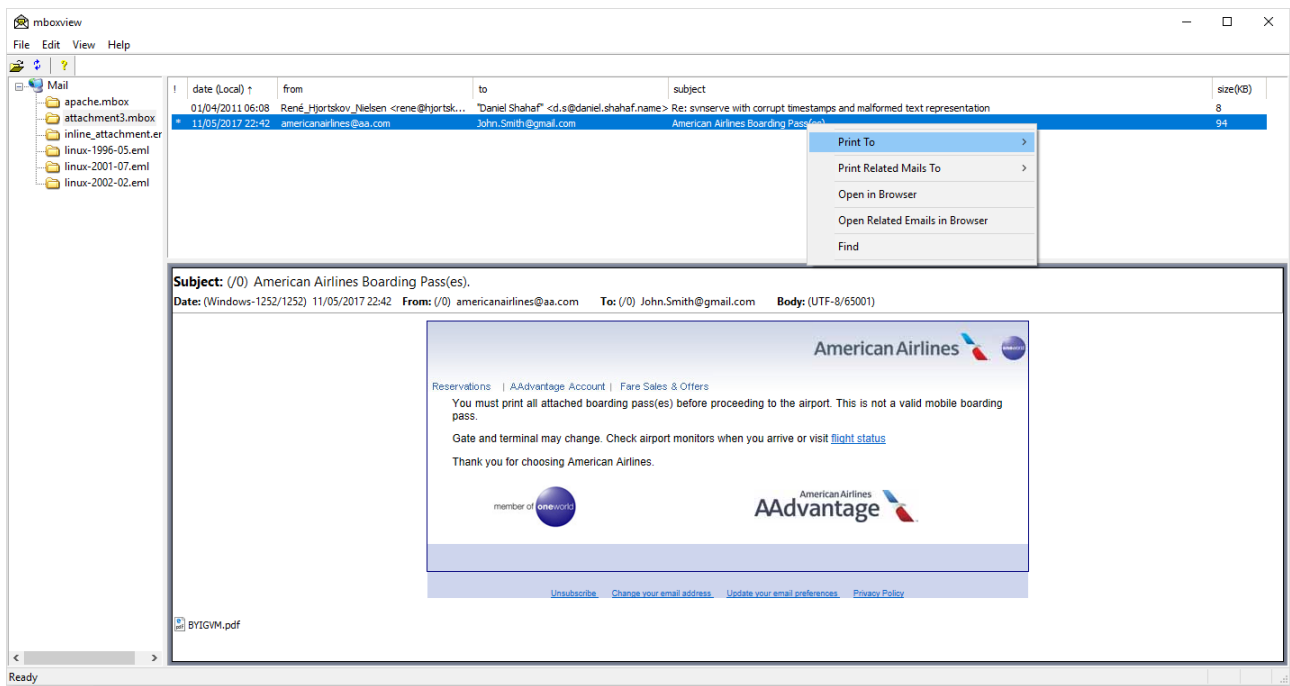

## 5.4 Mail Context Menu

Right Click on a selected email in the Summary Window to open the context menu as shown below.

The context menu allows to print the selected email or group of emails (conversations) to Text or HTML files or to open in the external default application. The name of the created file will be created based on the archive file name with the .txt or .html suffix in the directory housing the archive file.

The “Find” option allows to find user defined text and highlight all occurrences in the Message windows.

## 5.5 Mail Archive Context menu

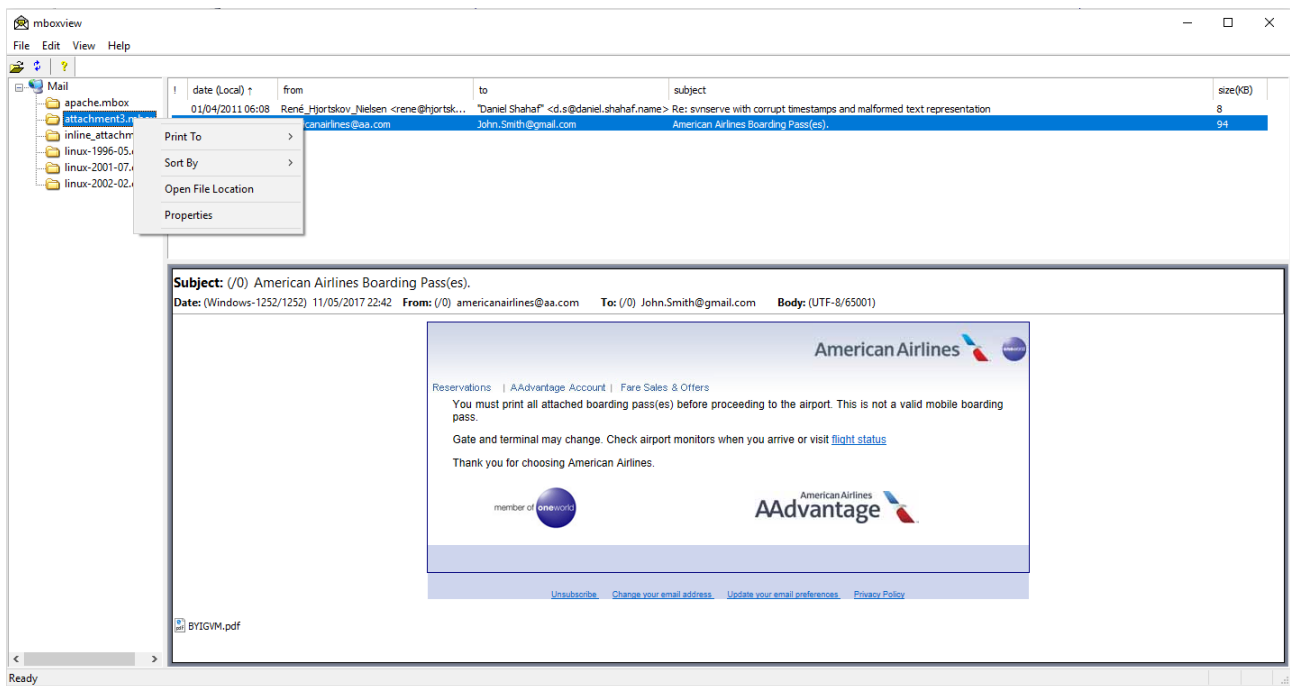

Right click on the active mail archive under the Mail Archive Tree Window to open the context menu as shown below.

The context menu allows to print all email to CSV or Text or HTML files. The name of the created file will be created based on the archive file name with the .csv or .txt or .html suffix in the directory housing the archive file.

All mails of the active archive can be sorted by date, from, to subject, size and conversations in the Summary Window. This feature is the same as the left click on the selected column in the Summary Window.

The “Properties” option shows the archive file location, size and email count.

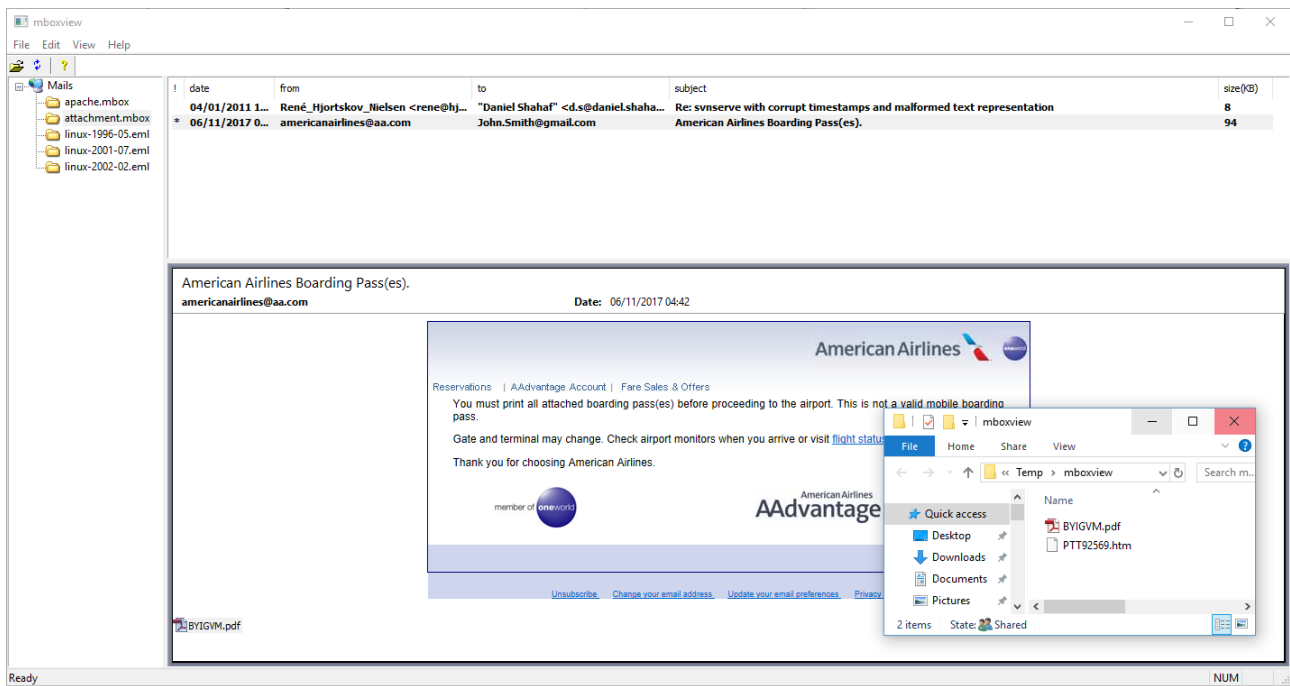

## 5.6 Mail Attachments

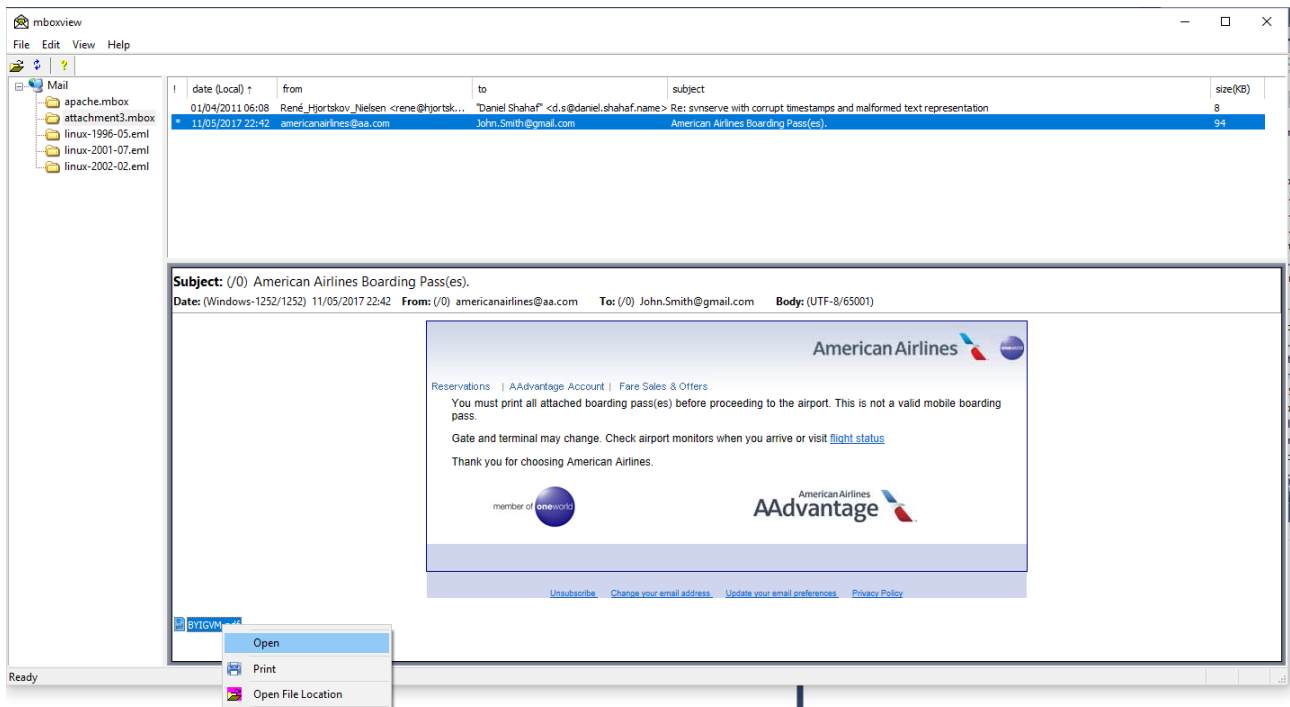

Mail attachments are shown at the bottom of the Message window. Note that the “\*” character may appear in the first column for the associated mail to indicate presence of associated attachments. To open location of attachments, double click on the mail in the Summary window or select “View” → “ViewEML” menu option. Temporary folder will open containing all attachments for the email. Use standard Windows applications to view attachments.

You can also double left click to view attachments. Picture attachments will be viewed in the Picture Viewer (if configured in the global Options) and other file types will be viewed by the associated default Windows applications.

## 5.6.1 Attachment context menu

Right click on the selected attachment to open the context menu. The context menu allows to open or print the attachment by the associated default application. You can also open the folder housing the attachment. The selected attachment will be highlighted in the folder.

## 5.7 Inline Image Cache

The mboxview will create the cache of inline images to support images embedded directly into the mail body/message. The cache is created during the initial parsing of the mail archive file. Separate

cache folder is created per each archive file (assuming at least one inline image was found) in the C:\Users\(\UserName)\AppData\Local\Temp\mbxview folder.

## 5.8 Picture Viewer

Click on any attachment to start Picture Viewer dialog, example below.

The Picture Viewer supports files with the png, jpg, jpeg, jpe, gif, bmp, ico, tif, tiff, jfif, emf, wmf, dib suffixes.

The NEXT and PREV controls enable user to browse all picture/image attachments associated with the selected email. You can select specific attachment to be displayed. You can later browse through all picture attachments.

The ROTATE control allow to rotate clockwise the current/visible picture.

The ZOOM control allows to zoom out picture in case the picture is blurry.

The PRINT control allow to print via default application.

The Picture Viewer is enabled by default but it can be disabled via FILE → Options dialog. Setting persists in the Registry across multiple runs.

All attachments are also accessible by double clicking on the selected mail in the Summary window or by selecting “View” → “ViewEML” menu option.

## 5.9 Mail Navigation

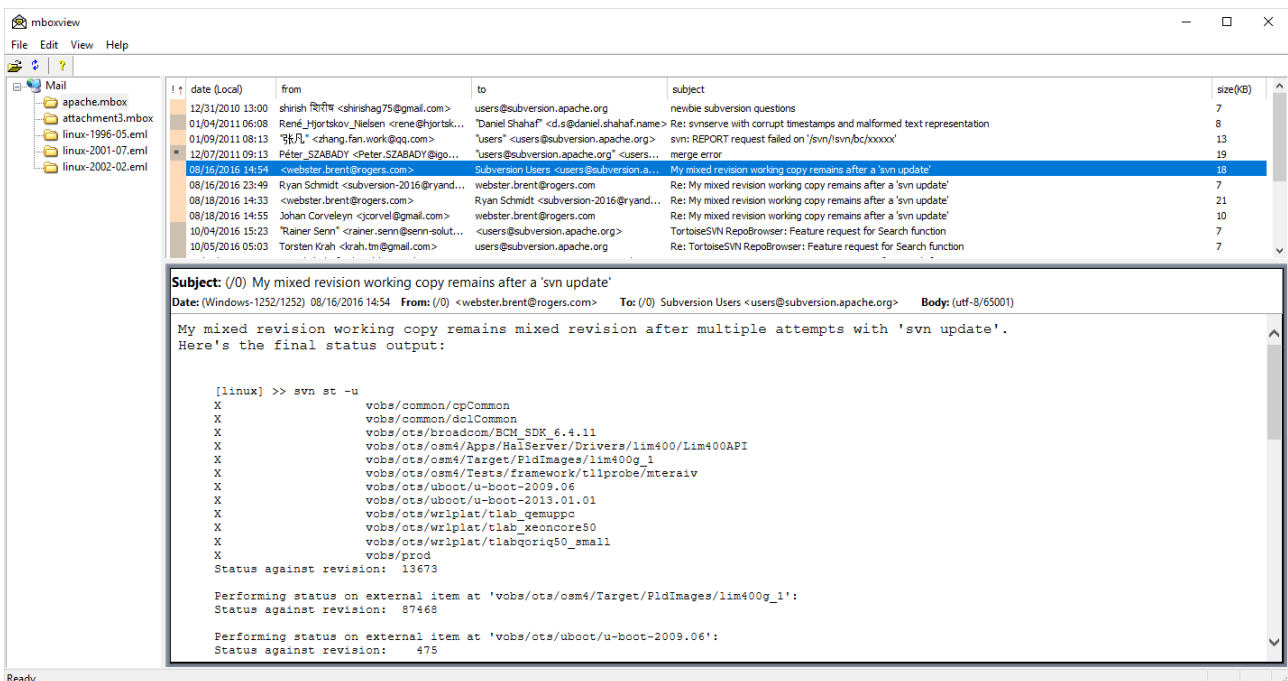

Click on a specific mail in the Summary window and use **UP**, **DOWN** keys to move to the next or previous mail respectively.

Use **HOME** key to jump to the first mail. Use **END** key to jump to the last mail.

## 5.10 Mail Sorting

The Summary window is divided into 6 columns: attachment indicator, date, from, to, subject and mail size. Each column can be sorted by clicking on the column title. Subsequent click on the same column title will reverse the sorting rule. By clicking on the attachment indicator title, emails are sorted by conversations and mark by different colour as shown below.

Mail can also be sorted via the mail archive context menu or by selecting “File”->“Sort By” menu option.

## 5.11 Dynamic Column Resize

Columns in the Summary windows are automatically resized when the window is resized.

However, if columns are resized manually, some of the columns may no longer be present in visible area/window.

You may need to use the scroll bar to see missing columns, otherwise maximize and then restore the window to see all columns within the Summary window again.

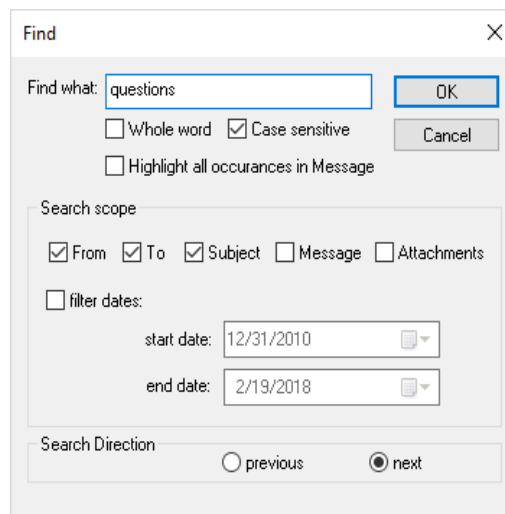

## 5.12 All Mails (Archive) Search

The mboxview allows users to configure the search scope by selecting all or subset of the from, to, subject, message and text attachments options.

Click the “Edit” drop menu and select “Find” option to configure and start the search. Alternatively the CTRL+F will also present the search dialog.

The search dialog box allows user to specify the search string, whether to match the whole word, whether the search is case sensitive, configure the search scope, the start and end dates to consider for filtering, the Next/Previous search direction and whether to highlight all occurrences of the matched text.

Note that the Next search start with the oldest email while the Previous search starts with the latest.

To repeat the search in order to find the next matching mail, click the “Edit” drop menu and select “Find again” option, or select F3 key.

If “Find again” or F3 key is selected without prior “Find” or CTRL+F, the search dialog box will be presented to a user.

### 5.12.1 Search Reliability

Searching may not work as expected in all cases due to different character sets on input and in the mails.

Base64 or “quoted-printable” text content blocks and text attachments are first decoded before the search to eliminate false negative results.

Searching of the header fields is performed on the raw received data.

Raw mail data may contain plain text and/or html text blocks. Both encode the same content. If the mail contains plain text blocks, only plain text will be searched. If the mail doesn’t contain any

plain text blocks, the html text blocks will be searched.

False positive results may happen when searching text/html content blocks since the html tags are not ignored when searching. The search string may match one of the html tags and result in false positive match.

If possible, use ASCII characters only to compose the search string.

### **5.12.2 Special Search Key**

The single character ‘\*’, i.e. the star character can be specified as the search string to enable traversing the subset of mails between the start and end dates.

### **5.12.3 Search Progress Bar**

Search progress bar displays the progress along the configured search string and enables user to cancel the search is so desired. The progress bar is not created unless a given search duration lasts longer than the delay time controlled by -PROGRESS\_BAR\_DELAY command line option or specified via GUI. Default value is 1 second.

### **5.12.4 Search Performance**

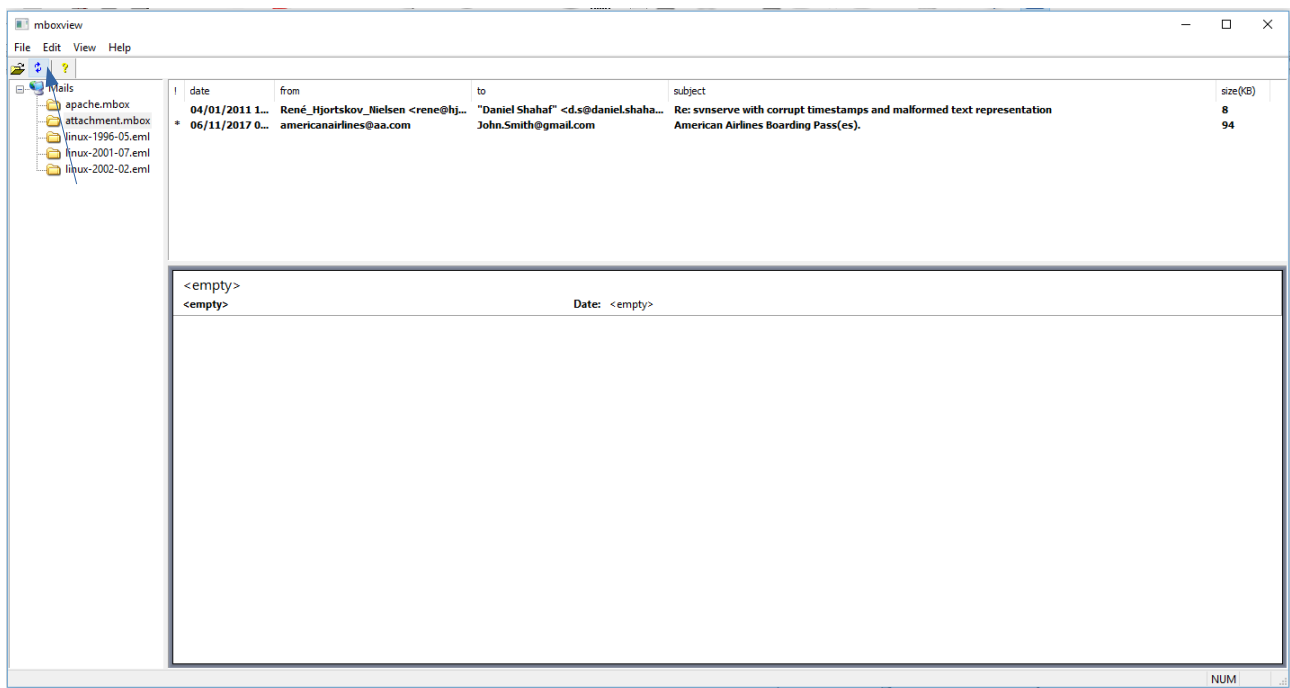

Searching of header fields performs best since all fields reside in the memory.

Searching of messages and text attachments may take some time for very large files, say larger than 10-20 Gbytes. Search requires to read the content blocks from the email file and decode the content when required. Worse case scenario is when the specified search string is not present in the mail archive. When activated, the search progress bar shows the configured search string and enables user to cancel the search is so desired.

Note that when searching of message and text attachments is configured, all mails will be sorted by date first, except when sorted by conversations, to maximize search performance.

## **5.13 Refreshing Archive Tree Window**

If an additional mbox or eml file is placed in the already selected folder, the Archive Tree window needs to be refreshed to see the new additions. This can be done by selecting “Refresh” option under the “File” drop menu or by clicking on the button showed below.

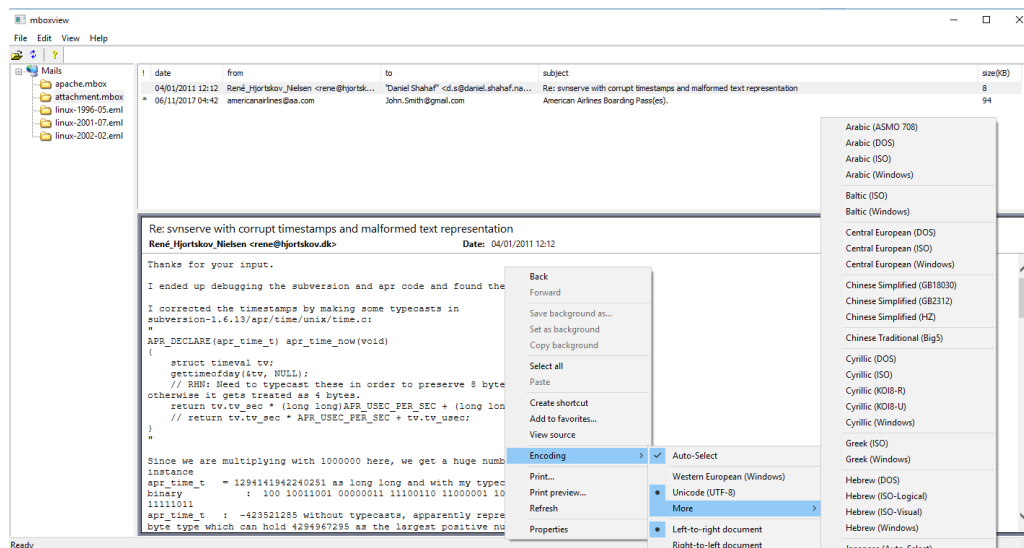

## 5.14 Language (Character Sets) Support

### 5.14.1 Message Window

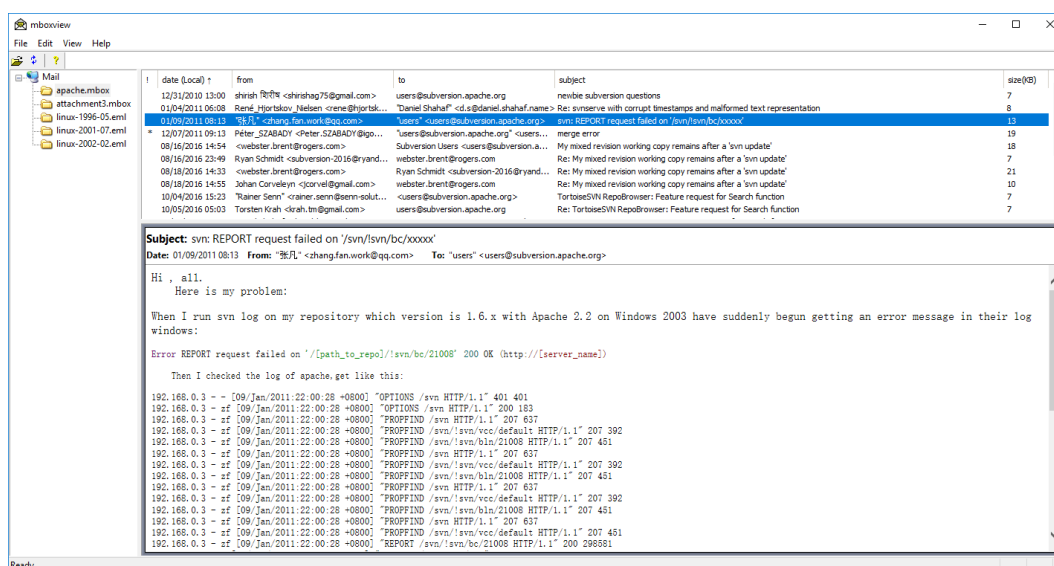

Different languages (character sets) are properly supported in the Message Window. This is thanks to the Microsoft Web Browser emulation/control class integrated into the mboxview. The mboxview generates the htm file from the mail's body and Web Browser displays the generated file in the Message window.

Display may not be correct if the character set for the mail's body is not defined in the mail. To resolve the incorrect display, you can try to apply different encoding by right clicking within the window, selecting "encoding" and "more" options to apply different language.

### 5.14.1.1 Header of Message Window

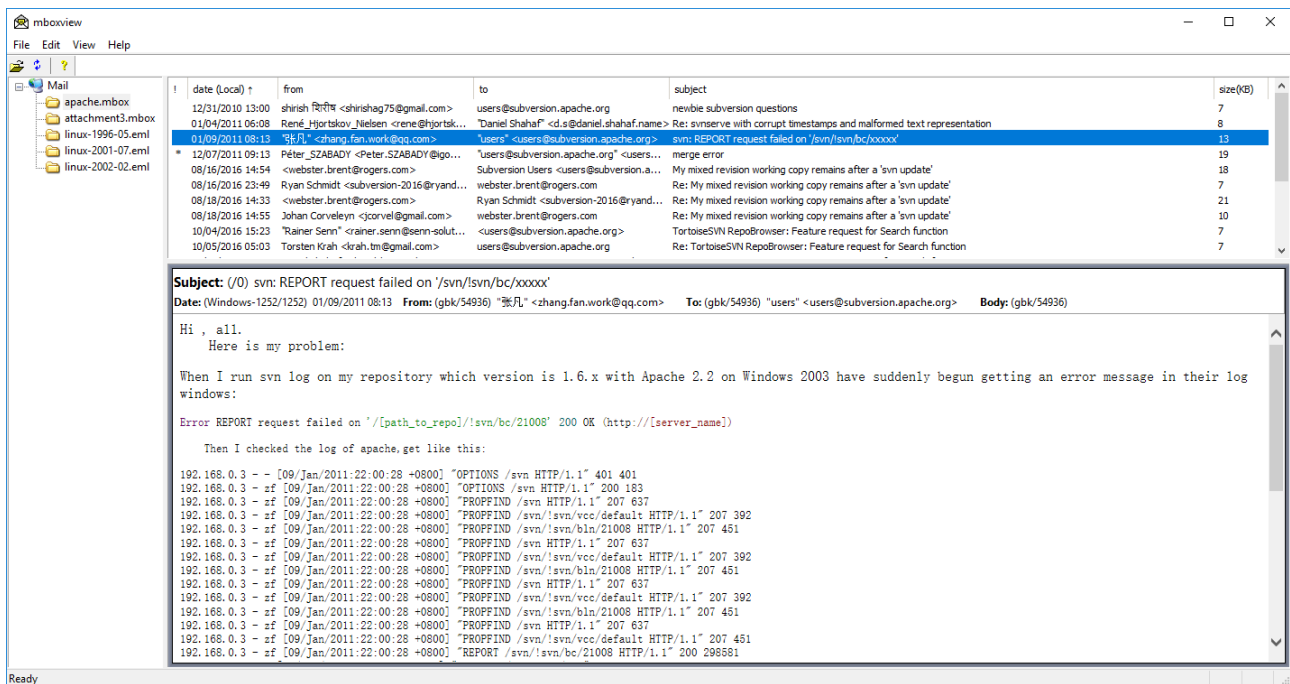

The text of the mail header fields is displayed correctly as long as the corresponding field encoding type is present in the email.

Two global options can be used to address incorrect field presentation in the Message Header in case the field encoding is not present in the email. Missing field encoding type may or may not be a problem. It should not be a problem if the default/local character set installed on your computer matches the original encoding of the header fields. It might be an issue if you are receiving emails from different countries.

As shown below, you can see all encoding/character sets applied to the header fields by enabling “Show Charsets” option. To enable, select “Options” from the “File” drop menu and enable “Show Charsets”.

If the field text presentation is not correct, you can try to configure character set (or so called code page according to Microsoft terminology) for the selected header fields and see if that helps. Per field code pages can be configured via Options dialog box. Note that the user provided encoding doesn't override encoding in the email, if present, which is denoted by the code page greater than zero. Code Page set to zero indicates missing or unknown character set.

If you change the code page value(s) in the Options Dialog box, you need to refresh the selected email by going up and down (or down and up).

All Windows supported code pages are listed in chapter 6 or can be viewed in the external Browser by selecting “View” → “View Code Page Ids”.

The character set information appears after the field title and is formatted as “(character set name/code page)”. The “\*” star character is appended after the code page if the user specified code is applied). Example “(UTF-8/65001\*)”.

The character set information after the “Date:” title shows the local/default character set installed on your computer.

### 5.14.2 Summary Window

Mail header fields are displayed correctly as long as the corresponding field encoding type is present in the email.

## 6 Windows Code Page Identifiers

The table below shows the supported character sets/code pages by Windows platform. The list is based on the following link.

CodePage	Name	Display Name
37	IBM037	IBM EBCDIC (US-Canada)
437	IBM437	OEM United States
500	IBM500	IBM EBCDIC (International)

65001	utf-8	Unicode (UTF-8)

## 6.1 Handling Unknown Code Page Names

In a few cases, mboxview will map unknown code names to the code names supported by Windows.

Unknown Code Name	Mapped To Code Name
gbk	GB18030
cp1252	Windows-1252
ascii	us-ascii
cp819	iso-8859-1
latin1	iso-8859-1
latin2	iso-8859-2
big-5	big5
SJIS	shift_jis
